# Milestones to Fusion Power Plant

# Education importance

Let's start with the tokamak GOLEM - *the smallest tokamak in the World with the biggest control room*

# The GOLEM tokamak basic characteristics

*The grandfather of all tokamaks (ITER newslines 06/18)*

- Vessel major radius:  $R_0 = 0.4$  m
- Vessel minor radius:  $r_0 = 0.1$  m
- Maximum plasma current:  
 $I_p^{\max} < 8$  kA
- Maximum toroidal magnetic field:  $B_t^{\max} < 0.5$  T
- Typical electron density:  
 $\langle n_e \rangle \in (0.2, 3) \cdot 10^{19} \text{ m}^{-3}$
- Maximum electron temperature:  
 $T_e^{\max} < 80$  eV
- Maximum discharge duration:  
 $\tau_p^{\max} < 25$  ms

## Tokamak

From Wikipedia, the free encyclopedia

*This article is about the fusion reaction device. For other uses, see [Tokamak \(disambiguation\)](#).*

A **tokamak** (Russian: **токамак**) is a device that uses a powerful magnetic field to confine plasma in the shape of a torus. Achieving a stable plasma equilibrium requires magnetic field lines that wrap around the torus in a helical shape. Such a helical field can be generated by adding a toroidal field

it decays into a proton and electron with the emission of energy. When the time comes to actually try to make electricity from a tokamak-based reactor, some of the neutrons produced in the fusion process would be absorbed by a liquid metal blanket and their kinetic energy would be used in heat-transfer processes to ultimately turn a generator.

### Experimental tokamaks [[edit](#)]

#### Currently in operation [[edit](#)]

(in chronological order of start of operations)

- 1960s: TM1-MH (since 1977 Castor; since 2007 Golem<sup>[122]</sup>) in Prague, Czech Republic. In operation in Kurchatov Institute since early 1960s but renamed to Castor in 1977 and moved to IPP CAS,<sup>[131]</sup> Prague; in 2007 moved to FNSPE, Czech Technical University in Prague and renamed to Golem.<sup>[14]</sup>
- 1975: T-10, in Kurchatov Institute, Moscow, Russia (formerly Soviet Union); 2 MW
- 1983: Joint European Torus (JET), in Culham, United Kingdom
- 1985: JT-60, in Naka, Ibaraki Prefecture, Japan; (Currently undergoing upgrade to Super, Advanced model)
- 1987: STOR-M, University of Saskatchewan; Canada; first demonstration of alternating current in a tokamak.
- 1988: Tore Supra,<sup>[15]</sup> at the CEA, Cadarache, France
- 1989: Aditya, at Institute for Plasma Research (IPR) in Gujarat, India
- 1980s: DIII-D,<sup>[16]</sup> in San Diego, USA; operated by General Atomics since the late 1980s
- 1989: COMPASS,<sup>[13]</sup> in Prague, Czech Republic; in operation since 2008, previously operated from 1989 to 1999 in Culham, United Kingdom
- 1990: FTU, in Frascati, Italy
- 1991: Tokamak ISTTOK,<sup>[17]</sup> at the Instituto de Plasmas e Fusão Nuclear, Lisbon, Portugal;
- 1991: ASDEX Upgrade, in Garching, Germany

# GOLEM

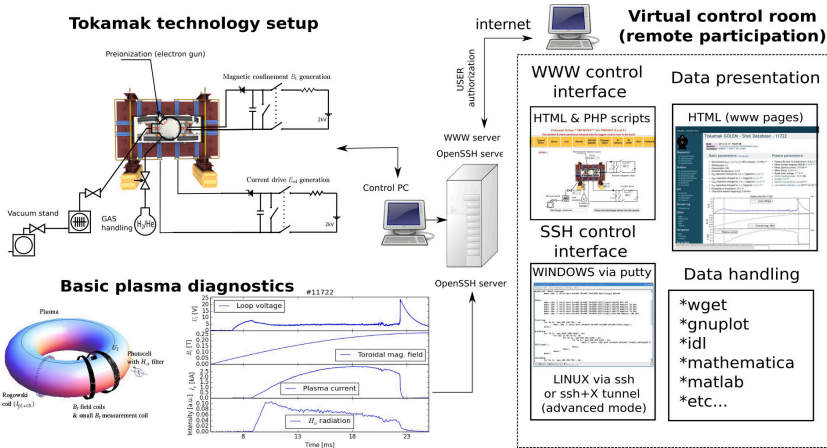

... somewhere, in the ancient cellars of Prague,

*there is hidden indeed "infernal" power. Yet it is the very power of celestial stars themselves. Calmly dormant, awaiting mankind to discover the magic key, to use this power for their benefit. . .*

At the end of the 16th century, in the times when the Czech lands were ruled by Emperor Rudolf II, in Prague, there were Rabbi Judah Loew, well known alchemist, thinker, scholar, writer and inventor of the legendary GOLEM - a clay creature inspired with the Universe power that pursued his master's command after being brought to life with a shem, . Golem is not perceived as a symbol of evil, but rather as a symbol of power which might be useful but is very challenging to handle. To learn more of the Golem legend, see e.g. [1].

Name	Experiment setup	Data acquisition system	Raw data	Analysis results
Basic Diagnostics				

# Basic diagnostics - numerical processing, raw data

The image shows a web browser displaying a diagnostics interface for a Golem system. The browser address bar shows the URL: `http://golem.fjfi.cvut.cz/shots/39187/Devices/Oscilloscopes/TektrMSO56-a/`. The interface is titled "GOLEM - Shot #39187" and features a sidebar with navigation options like "Diagnostics", "Other", and "Navigation". The main content area is titled "On stage diagnostics" and includes a "Data flow" diagram with stages: "Name", "Experiment setup", "Data acquisition system", "Raw data", and "Analysis results". A red circle highlights a specific data point in the "Raw data" section, with a red arrow pointing from it to a file listing below. The file listing is titled "Index of /shots/39187/Devices/Oscilloscopes/TektrMSO56-a" and contains the following entries:

Name	Last modified	Size	Description
<a href="#">Parent Directory</a>	-	-	-
<a href="#">BasicDiagnostics.sh</a>	2022-05-18 17:58	3.2K	
<a href="#">ScreenshotAll.png</a>	2022-05-18 17:58	184K	
<a href="#">TektrMSO56_ALL.csv</a>	2022-05-18 17:58	3.9M	
<a href="#">Universals.sh</a>	2022-05-18 17:58	1.2K	
<a href="#">das.jpg</a>	2022-05-18 17:58	13K	
<a href="#">ls-all</a>	2022-05-18 17:58	2.4K	
<a href="#">rawdata.jpg</a>	2022-05-18 17:58	13K	

At the bottom of the page, it says: "Apache/2.4.38 (Debian) Server at golem.fjfi.cvut.cz Port 80". A red arrow points from the "BasicDiagnostics.sh" file in the index to the "BasicDiagnostics" section in the diagnostics interface above.

# Basic diagnostics - numerical processing, Jupyter-notebook@GitLab Download & play

The screenshot displays a web browser window showing a GitLab repository page for 'Tokamak GOLEM Basic diagnostics'. The browser address bar shows the URL: <https://gitlab.com/golem-tokamak/dirigent/-/blob/master/Diagnostics/basicDiagnostics/StandardDAS.ipynb>. The page header includes navigation tabs: 'Data flow', 'Measurement', 'Data acquisition system', 'Raw data', and 'Analysis results'. Below the header is a navigation bar with 'About GitLab', 'Pricing', 'Talk to an expert', a search bar, and 'Sign up now' / 'Login' buttons. The left sidebar shows the repository structure: 'Dirigent', 'Project information', 'Repository', 'Files', 'Commits', 'Branches', 'Tags', 'Contributors', 'Graph', 'Compare', 'Locked Files', 'Issues', 'Merge requests', 'CI/CD', 'Deployments', and 'Collapse sidebar'. The main content area shows the file 'StandardDAS.ipynb' (19.83 KIB) with a download icon and an 'Open in Web IDE' button. The notebook content includes the title 'Tokamak GOLEM Basic diagnostics', a procedure link '(This notebook to download)', a link to 'bash wrapper, Error log', and a section for 'Prerequisites: function definitions' with 'Load libraries'. The code block contains the following Python code:

```
%matplotlib inline
import os
import numpy as np
import matplotlib.pyplot as plt
from scipy import constants, integrate, signal, interpolate
import sqlalchemy # high-level library for SQL in Python
import pandas as pd
import subprocess
```

# Basic diagnostics - numerical processing, Jupyter-notebook applied on the Discharge #

Procedure ([This notebook to download](#))

[bash wrapper](#), [Error log](#)

## Prerequisites: function definitions

Load libraries

```
In [1]: %matplotlib inline
import os
import numpy as np
import matplotlib.pyplot as plt
from scipy import constants, integrate, signal, interpolate
import sqlalchemy # high-level library for SQL in Python
import pandas as pd
import subprocess
```

For interactive web figures

```
In [2]: import holoviews as hv
hv.extension('bokeh')
import hvplot.pandas
```

For conditional rich-text boxes

```
In [3]: from IPython.display import Markdown
```

# Loop voltage $U_l$ @ the GOLEM tokamak

# Basic diagnostics - numerical processing, $U_{loop}$

```
t_scale = 1e-3 if in_seconds else 1
if is_plasma:
    for t in (t_plasma_start, t_plasma_end):
        plt.axvline(t = t_scale, color='k', linestyle='--')
```

## $U_l$ management

Check the data availability

```
In [11]: loop_voltage = read_signal(shot_no, 'U_Loop')
polarity_CD = read_parameter(shot_no, 'CD_orientation')
if polarity_CD != 'CW': # T000 hardcoded for now!
    loop_voltage *= -1 # make positive
loop_voltage = correct_inf(loop_voltage)
loop_voltage.loc[is_CD] = 0
ax = loop_voltage.plot(grid=True)
show_plasma_limits()
ax.set(xlabel='Time [s]', ylabel='SU_LS [V]', title='Loop voltage SU_LS #{}'.format(shot_no));
```

```
Out[11]: [Text(0.5, 0, 'Time [s]'),
Text(0, 0.5, 'SU_LS [V]'),
Text(0.5, 1.0, 'Loop voltage SU_LS #39187')]
```

## $B_l$ calculation

Check the data availability

It is as magnetic measurement, so the raw data only give  $\frac{dB_l}{dt}$

```
In [12]: dBt = read_signal(shot_no, 'U_BtCoil')
polarity_BT = read_parameter(shot_no, 'BT_orientation')
if polarity_BT != 'CW': # T000 hardcoded for now!
    dBt *= -1 # make positive
dBt = correct_inf(dBt)
dBt -= dBt.loc[offset_s1].mean()
ax = dBt.plot(grid=True)
show_plasma_limits()
ax.set(xlabel='Time [s]', ylabel='dBt [V]', title='BTCoil raw signal #{}'.format(shot_no));
```

# Toroidal magnetic field $B_t$ @ the tokamak GOLEM

# Basic diagnostics - numerical processing, $B_t$

## $B_t$ calculation

### Check the data availability

It is as magnetic measurement, so the raw data only give  $\frac{dB_t}{dt}$

```
In [12]: dBt = read_signal(shot_no, '0_BtCoil')
polarity_Bt = read_parameter(shot_no, 'Bt_orientation')
if polarity_Bt != 'CW':
    dBt *= -1 # make positive # 1000 hardcoded for now!
dBt = correct_infidBt
dBt = dBt.loc[offset_start:offset_end]
ax = dBt.plot(grid=True)
show_plasma_limits()
ax.set(xlabel='Time [s]', ylabel='dBt [B/s]', title='BtCoil_raw signal #{}'.format(shot_no));
```

```
Out[12]: [Text(0.5, 0, 'Time [s]'),
Text(0, 0.5, 'dBt [B/s]', title='BtCoil_raw signal #39187')]
Text(0.5, 1.0, 'BtCoil_raw signal #39187')]
```

### Integration (it is a magnetic diagnostic) & calibration

```
In [13]: K_BtCoil = float(read_parameter(shot_no, 'SystemParameters/K_BtCoil')) # Get BtCoil calibration factor
print('BtCoil calibration factor K_BtCoil={}'.format(K_BtCoil))
BtCoil calibration factor K_BtCoil=70.42 T/V/s)
```

```
In [14]: BT = pd.Series(integrate.cumtrapz(dBt, axis=dBt.index, initial=0) * K_BtCoil,
index=dBt.index, name='Bt')
ax = BT.plot(grid=True)
show_plasma_limits()
ax.set(xlabel='Time [s]', ylabel='Bt [T]', title='Toroidal magnetic field Bt ts #{}'.format(shot_no));
```

```
Out[14]: [Text(0.5, 0, 'Time [s]'),
Text(0, 0.5, 'Bt [T]', title='Toroidal magnetic field Bt ts #39187')]
Text(0.5, 1.0, 'Toroidal magnetic field Bt ts #39187')]
```

# Total current $I_{ch+p}$

# Basic diagnostics - numerical processing, $U_{ch+p}$

Chamber (+ Plasma) current  $I_{p+ch}$  calculation

The Rogowski coil around the chamber measures the total current contained within its boundaries. Therefore, if there is plasma, it measures the sum of the plasma and chamber currents. In a vacuum discharge it measures only the chamber current.

Check the data availability

Because it is a magnetic measurement, the raw data only gives  $\frac{dI_{p+ch}}{dt}$

```
In [131]: dIpch = read_signal(shot_no, 'RogCoil') # 5000 horizontal for now
if dIpch[0] == 0:
    dIpch = 1 # non active
dIpch = correct_bias(dIpch)
dIpch = dIpch * (1/500) # subtract offset
dIpch[0] = 0
ax = dIpch.plot(grid=True)
show plasma limits()
ax.set(xlabel='Time [s]', ylabel='dI_{p+ch} [A]', title='RogowskiCoil raw signal #131'.format(shot_no))
```

Integration (it is a magnetic diagnostic) & calibration

```
In [130]: K_RogowskiCoil = float(read_parameter(shot_no, 'SystemParameters/K_RogowskiCoil')) # Get RogowskiCoil calibration factor
print('RogowskiCoil calibration factor: K_RogowskiCoil={0:1.6f}'.format(K_RogowskiCoil))
In [132]: Ipch = pd.Series(integrate.cumtrapz(dIpch, x=dIpch.index, initial=0) * K_RogowskiCoil,
                        x=dIpch.index, name='Ipch')
ax = Ipch.plot(grid=True)
show plasma limits()
ax.set(xlabel='Time [s]', ylabel='I_{p+ch} [A]', title='Total (plasma+chamber) current #131'.format(shot_no))
```

Chamber current  $I_{ch}$  calculation

```
In [133]: R_chamber = float(read_parameter(shot_no, 'SystemParameters/R_chamber')) # Get Chamber resistivity
print('Chamber resistivity R_chamber={0}'.format(R_chamber))
Chamber resistivity R_chamber=0.097 Ohm
In [134]: I_chamber = float(read_parameter(shot_no, 'SystemParameters/I_chamber')) # Get Chamber inductance
print('Chamber inductance L_chamber={0}'.format(L_chamber))
Chamber inductance L_chamber=46.6 H
```

```
In [131]: for i in range(shot_no, shot_no + 1):
ax = I.plot()
ax.legend()
show plasma limits()
ax.set(xlabel='Time [s]', ylabel='I_{p+ch} [A]', title='estimated chamber current and measured total')
plt.grid()
```

Plasma current  $I_p$  calculation

If there is plasma, the plasma current can be estimated as the difference between the total measured current and the estimated chamber current  $I_p = I_{p+ch} - I_{ch}$

```
In [122]: if is_plasma:
    Ip_name = Ipch - loop_voltage/R_chamber # creates a new Series
    Ip = Ipch - I_ch
    Ip.name = 'Ip'
    Ip.name.plot(grid=True, label='naive I_{p} [A] (ch)')
    ax = Ip.plot(grid=True, label='using SQ_{p} = R_{ch} I_{ch} - L_{ch} \cdot \frac{dI_{ch}}{dt} [A]')
    ax.legend()

**Without Analysis**

### Basic Diagnostics

The figure shows three vertically stacked plots of diagnostic data over a 25 ms interval. The top plot shows voltage U(t) in Volts, the middle plot shows magnetic field B(t) in Tesla, and the bottom plot shows current I(t) in Amperes. All plots have a common x-axis labeled 'time [ms]' ranging from 0 to 25. Vertical dashed lines indicate specific time points in the discharge sequence.

The image displays the GOLEM remote control interface. At the top, a navigation bar includes 'GOLEM remote', 'Introduction', 'Control room', 'Live', and 'Results'. The 'Control room' section is active, showing tabs for 'Introduction', 'Working gas', 'Preionization', 'Magnetic field', 'Electric field', and 'Submit'. The 'Working gas' tab is selected, displaying instructions on setting gas pressure and type. A schematic diagram of the tokamak system is shown, including a vacuum stand, gas handling system, and toroidal magnetic and electric fields. Below the diagram, a slider controls the gas pressure, currently set to 16 mPa, with radio buttons for 'Hydrogen' and 'Helium'. A 'Next' button and a 'Set recommended value' button are at the bottom. To the right, a 3D model rendering of the tokamak is shown, with a red arrow pointing to it from the text '3D model rendering'. The rendering settings are set to 'Static image (fast)'. A red arrow points from the text 'engineering scheme' to the schematic diagram. Another red arrow points from the text 'sliders and checkboxes' to the pressure slider. A final red arrow points from the text 'workflow buttons' to the 'Next' and 'Set recommended value' buttons.

# GOLEM basic Data Acquisition System (DAS)

- $U_I, U_{B_t}, U_{I_{p+ch}}, I_{rad}$
- $\Delta t = 1\mu s / f = 1MHz.$
- Integration time = 40 ms, thus DAS produces 6 columns x 40000 rows data file.
- Discharge is triggered at 5th milisecond after DAS to have a zero status identification.

Data file example, DAS  $\Delta t = 1\mu s / f = 1MHz$  (neutral gas into plasma breakdown focused)

# GNU Wget

GNU Wget is a free software package for retrieving files using HTTP, HTTPS and FTP, the most widely-used Internet protocols. It is a non-interactive commandline tool, so it may easily be called from scripts, cron jobs, terminals without X-Windows support, etc.

- Runs on most UNIX-like operating systems as well as Microsoft Windows.
- Homepage: <http://www.gnu.org/software/wget/>
- Basic usage:
  - To get  $U_l$ : `wget http://golem.fjfi.cvut.cz/utis/data/<#ShotNo>/loop_voltage`
  - To get whole shot: `wget -r -nH -cut-dirs=3 -no-parent -l2 -Pshot http://golem.fjfi.cvut.cz/shots/<#ShotNo>`

# Excel

# Towards ... Energy confinement time

## House

## Tokamak

- Net power = Efficiency  $\times$  (Fusion - Radiation loss - Conduction loss)
- The confinement time:  $\tau_E = \frac{W}{P_{\text{loss}}}$
- Energy density  $W = 3nk_B T$  & rate of radiation and conduction energy loss per unit volume  $P_{\text{loss}}$
- Reactions per volume per time of fusion reactions is:  
 $f = n_d n_t \langle \sigma v \rangle = \frac{1}{4} n^2 \langle \sigma v \rangle$
- Fusion heating  $fE_{\text{ch}}$ , where  $E_{\text{ch}} = 3.5 \text{ MeV}$  should exceed the losses:  
 $fE_{\text{ch}} \geq P_{\text{loss}}$

$$n\tau_E \geq L \equiv \frac{12}{E_{\text{ch}}} \frac{k_B T}{\langle \sigma v \rangle} \geq 1.5 \cdot 10^{20} \frac{\text{s}}{\text{m}^3}$$

(DT reaction @ minimum  $\approx 26 \text{ keV}$ )

## Energy confinement time

Under the assumption of a simplified power balance, the heating power  $P_H$  is partially absorbed in the plasma and leads to an increase of the plasma energy  $W_p$  and the rest is lost as the loss power  $P_{Loss}$

$$P_H = \frac{dW_p}{dt} + P_{Loss}$$

The energy confinement time is defined as the characteristic time scale of the exponential decay of the plasma energy  $W_p$  due to the loss power  $P_{Loss}$ :

$$\tau_E = \frac{W_p}{P_{Loss}} = \frac{W_p}{P_H - dW_p/dt}$$

Choosing the quasistationary phase of the plasma discharge, where  $\frac{dW_p}{dt} = 0$  gives:

$$\tau_E(t) = \frac{W_p(t)}{P_H(t)}$$

# The discharge - quasistationary phase

## Plasma heating power

On the GOLEM tokamak the only heating mechanism of the plasma is ohmic heating  $P_{OH}$  resulting from the plasma current  $I_p$  flowing in a conductor with finite resistivity  $R_p$ . The time dependence of the ohmic heating power can be calculated as:

$$P_H(t) = P_{OH}(t) = R_p(t) \cdot I_p^2(t)$$

# Plasma Energy

The global plasma energy content  $W_p$  can be simply calculated from the temperature estimation  $T_e(0, t)$ , average density  $n_e$  and plasma volume  $V_p$ , based on the ideal gas law, taking into account the assumed

$T_e(r, t) = T_e(0, t) \left(1 - \frac{r^2}{a^2}\right)^2$  temperature profile:

$$W_p(t) = V_p \frac{n_e k_B T_e(0, t)}{3}.$$

The information that the magnetic field reduces the degrees of freedom of the particles to two has been used to derive this formula.

- $V_p \approx 80 \text{ l}$

## Central Electron Temperature estimation (Spitzer Formula)

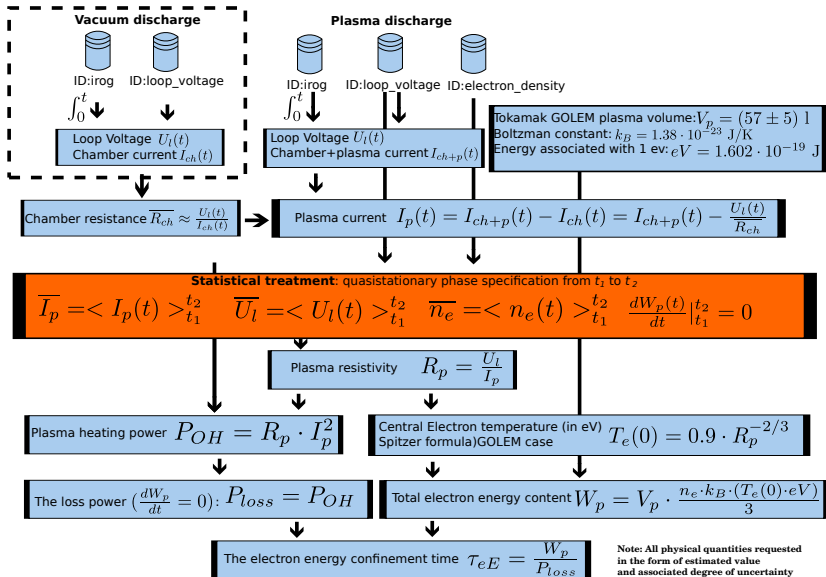

The time evolution of the central electron temperature  $T_e(0, t)$  is calculated from equation based on Spitzer's resistivity formula (see eg. [2],[4]):

$$T_e(0, t) = \left( \frac{R_0}{a^2} \frac{8Z_{eff.}}{1544} \frac{1}{R_p(t)} \right)^{2/3}, [eV; m, \Omega]$$

For particular case of the GOLEM tokamak it says:

$$T_e(0, t) = 0.9 \cdot \left( \frac{I_p(t)}{U_I(t)} \right)^{2/3}, [eV; A, V]$$

# Schematic of electromagnetic diagnostics

# Rogowski coil for the (chamber & plasma) current $I_{ch+p}$ measurements

## Rogowski coil

- Ampere's Law:  $\nabla \times \mathbf{B} = \mu_0 \mathbf{j}$   
(neglecting  $\dot{\mathbf{D}}$ )
- current through (const) surface  $S$ :  
$$\int \mathbf{j} \cdot d\mathbf{S} = I_{ch+p}$$
- (const) poloidal field along surface border  $l$ :  $\int \nabla \times \mathbf{B} \cdot d\mathbf{S} = \oint B_p dl = I B_p$
- voltage induced:  $U_{I_{ch+p}} + U_t - U_t = -N \dot{B}_p S_c = -\mu_0 \frac{N S_c}{l} \dot{I}_{ch+p}$
- The wire of the coil is back-wound to omit a strong toroidal magnetic field  $B_t$  signal.

# Magnetic measurements generally I

- Raw signals (analog  $U_r(t)$  or, respectively, its discretized digital  $U_i$  counterpart form ) must be specially maintained:
  - corrected for the DC bias  $U_{offset}$  of the measurement circuit,
  - integrated (pure diagnostics signal voltage  $U_d(t)$  is induced by the time derivative of the appropriate magnetic flux),
  - multiplied by calibration factors  $C_d$  ( $C_{Bt}$ ,  $C_{RC}$ ).
- We can express the basic relationship  $U_r(t) = U_d(t) + U_{offset}$
- The measured signal  $U_d(t)$  is proportional to the time derivative of the original physical quantity  $D(t)$  signal (it is a magnetic measurement):

$$U_d(t) \propto \frac{dD(t)}{dt}, \text{ or } U_d(t) = C_d \frac{dD(t)}{dt}$$

Where the linearity coefficient  $C_d$  is called a calibration factor.

## Magnetic measurements generally II

- To determine the desired physical quantity  $D(t)$ , we just have to perform an integration over time:

$$D(t) = \frac{1}{C_d} \int_0^t U_d(t') dt' = \frac{1}{C_d} \int_0^t (U_r(t) - U_{offset}) dt'$$

- In reality, the measurement is not continuous. The system performs a series of measurements  $U_i$  separated by with time step  $\Delta t = 1 \text{ us}$ .
- In practice, we replace the integral by a sum:

$$D_i = \frac{1}{C_d} \sum_{j=0}^{t/\Delta t} (U_i(t_j) - U_{offset}) \Delta t$$

$$D_i = \frac{1}{C_d} \left( \sum_{j=0}^{t/\Delta t} U_i(t_j) \right) - U_{offset} t$$

- The offset  $U_{offset}$  can be specified from the beginning of the data series before switching on the real experiment.
